1.4
1.1
HotSpot accumulation threshold = 1 °C
accumulate HotSpot values ≥ 1 °C
12-week accumulation — 12 week positions = 84 days;
each qualifying week contributes its HotSpot value
DHW = 7.4 °C·weeks
PersA(t) = clip(DHW(t)/10, 0, 1)
PersA = 0.74 ∈ [0, 1]
same fixed DHW/10 mapping across basins
standardized thermal-stress coordinate; not a novel predictor or biological label
b
Frozen TSCF vs anchor across basins
Frozen TSCF shows marked CARIB degradation
PersA (anchor)
TSCF (frozen)
SCS (source)
GBR (zero-shot)
CARIB (zero-shot)
ROC-AUC
PR-AUC
c
CARIB: thermal anchoring restores transfer performance
score (95% CI)
left cluster: ROC-AUC
right cluster: CSI@0.9
PersA
ungated
gated
TSCF
d
CARIB reliability (calibration recovery)
PersA (Brier 0.014, ECE 0.066)
gated residual (Brier 0.014, ECE 0.077)
TSCF (Brier 0.098, ECE 0.306)
observed severe frequency
mean predicted severe thermal risk
